

• WATERBOB STEP-BY-STEP INSTALLATION INSTRUCTIONS

Lay the WaterBOB™ liner flat and centered in the bath tub with the nozzles (white caps) facing up.

Unscrew the nozzle cap that is closest to the faucet and attach the fill sock to that nozzle by turning it clockwise until tight. Slide the other end of the fill sock over the bathtub faucet.

Hold the fill sock firmly around the faucet with one hand while your other hand turns on the cold water. Turn it off when the water level reaches about one inch from the top of the liner. Remove the fill sock and replace it with a white cap and tighten.

When you are ready for water, remove the center nozzle cap and thread on the siphon pump by turning in a clockwise motion.

To dispense the water, insert the fill tube in an empty jug or pitcher and squeeze the red bulb.

You will need to pump several times to begin the siphon effect. To stop the water flow, loosen the vent cap located on top of the pump.

When fresh water is no longer needed, slit the side of the liner and drain the remaining water. Dispose of the empty bag and please recycle.

To keep the water fresh, close any window treatments and place towels over the liner to block sunlight.
